#### Abstract

A ring-contraction strategy applied to $\beta$-azido, $\gamma$-hydroxyazepanes yielded after functional group manipulation new tetrahydroxylated pyrrolidines displaying an acetamido moiety, one of these iminosugars demonstrating low micromolar inhibition on $N$-acetylglucosaminidases.

Keywords. Iminosugars, Ring-contraction, Glycosidase inhibitors, Pyrrolidines

## Highlights.

-A new family of amino-functionalised pyrolidines was synthesized.
-Aring-contraction of $\beta$-azido, $\gamma$-hydrox yazepanes was used.
-A low micromolar inhibitor of $\beta$ - N -acetylehexosaminidase identified.

Polyhydroxylated pyrrolidines ${ }^{1,2}$ are well-established powerful glycosidase inhibitors, even though their analogy with hexopyranoses, and therefore the structural basis of their inhibition, are less straightforward than for the corresponding piperidines. ${ }^{3}$ Hexosaminidases are a very important class of glycosidases that cleave the pyranosidic $N$-acetyl-D-glucosamine unit from glycoconjugates. Several pyrrolidines bearing an acetamide group have been reported as potent hexosaminidases inhibitors. Interestingly, only one naturally occuring acetamido-containing pyrolidine was isolated so far: Pochonicine. ${ }^{4-6}$ The main classes of synthetic nitrogen functionalized polyhydroxylated pyrrolidines are represented in Figure 1, the most studied one being the 2,5-dideoxy-2,5-iminohexitols $\mathbf{A}^{7-21}$ but other scaffolds such as $\mathbf{B},{ }^{22-24} \mathbf{C},{ }^{25-26} \mathbf{D}^{27} \mathbf{E}^{28}$ and $\mathbf{F}^{8}$ have also been prepared. It is rather stricking that structure $\mathbf{G}$, which can be seen as a combination of $\mathbf{A}$ and $\mathbf{E}$ possessing as many hydroxyl groups as the hexosaminidase substrate and product, has never been synthesized and assessed as a hexosaminidase inhibitor. The present study reports the synthesis and hexosaminidase inhibitory evaluation of molecules derived from scaffold G. (Figure 1)

In the course of our studies aimed at the synthesis of GlcNAc-like piperidine homoiminosugars exploiting a ring-contraction methodology, ${ }^{29-32}$ a 2,3-trans-2-hydroxy,3-azido-azepane was required and obtained from the unsaturated 7membered ring $1 .{ }^{33}$ The obvious synthetic route transits via the formation of an epoxide, followed by its azidolysis. We observed that it was possible to operate the epoxydation with some degree of stereocontrol to afford either epoxides $\mathbf{2}$ or $\mathbf{3}$ as the main products. ${ }^{33}$ These latter could then be opened using sodium azide to give, in both cases, a significant amount of the 2 -azido derivatives 4 and 6 together with the desired 3 -azido compounds 5 and $7 .{ }^{33}$ (Scheme 1)

Scheme 1 : Synthesis of azidoazepanes 4-7. Reagents and conditions: a) Oxone, D-epoxone, $\mathrm{NaHCO}_{3}, 2: 54 \%$, b) Oxone, $\mathrm{CF}_{3} \mathrm{COCH}_{3}, \mathrm{NaHCO}_{3}, 2: 29 \%, 3: 51 \%$; c) $\mathrm{NaN}_{3}, \mathrm{NH}_{4} \mathrm{Cl}$, DMF/ $/ \mathrm{H}_{2} \mathrm{O}, 90^{\circ} \mathrm{C}$

Compounds $\mathbf{4}$ and $\mathbf{6}^{33}$ are also suitable candidates for a ring contraction reaction ${ }^{34}$ to give pyrrolidine derivatives ${ }^{35}$ through a $\gamma$-aminoacohol rearrangement. Hence, we decided to apply the TFAA-mediated ring contraction conditions developped by Cossy ${ }^{36}$ to $\beta$-azidoazepanes 4 and $\mathbf{6}$ that were first converted into the $N$-benzyl derivatives 8 ( $80 \%$ ) and $\mathbf{1 3}$ ( $68 \%$ ) respectively, using TFA followed by $N$ benzylation ( $\mathrm{BnBr}, \mathrm{K}_{2} \mathrm{CO}_{3}$ ). Their ring contraction with TFAA furnished the azidopyrrolidines 9 (93\%) and 14 (86\%) respectively in good yield. Reduction of the azide moiety $\left(\mathrm{PPh}_{3}, \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}\right)$ followed by N -acetylation was achieved to provide the acetamide $\mathbf{1 0}(80 \%)$ and $\mathbf{1 5}(60 \%)$ respectively. Final $O$-deacetylation followed by hydrogenolysis yielded the target pyrrolidines 11 (95\%) and $\mathbf{1 6}$ $(88 \%)$. Compound 9 was also directly submitted to the action of hydrogen in the presence of $\mathrm{Pd} / \mathrm{C}$ to give the diamine $\mathbf{1 2}$ in $95 \%$ yield as its hydrochloride salt (Scheme 2).

Scheme 2 : Synthesis of NHAc derived pyrrolidines 11 and 16. Reagents and conditions: a) i)TFA, DCM; ii) $\mathrm{BnBr}, \mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{EtOAc} / \mathrm{H}_{2} \mathrm{O}$; b) i) Trifluoroacetic anhydride (TFAA), $\mathrm{Et}{ }_{3} \mathrm{~N}$, toluene, reflux, ii) $10 \%$ aq. NaOH ; c) i) $\mathrm{PPh}_{3}, \mathrm{THF} / \mathrm{H}_{2} \mathrm{O}, 80^{\circ} \mathrm{C}$, ii) Pyridine, $\mathrm{Ac}_{2} \mathrm{O}$; d) i) $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{MeOH}, \mathrm{H}_{2} \mathrm{O}$, ii) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, \mathrm{HCl}$; e) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, \mathrm{HCl}$

The ring contraction reaction is initiated by the esterification of the free hydroxyl group in azepane $\mathbf{1 3}$ to give intermediate $\mathbf{H}$, in which the amine displaces this leaving group to produce the fuded pyrrolidine-azetidinium ion I. Nucleophilic ring opening at the less hindered carbon affords pyrrolidine $\mathbf{J}$ which leads to the five-membered iminosugar 14 upon saponification. The stereochemistry of the ring-contracted product is the one expected by this mechanism as attested by the NOE cross-correlation between H-3 and H-5 on 14. (Scheme 3)

The three pyrrolidines 11, 12 and 16 were assayed as inhibitors of a panel of hexosaminidases and $\beta$-glucuronidases. Iminosugar 11 is a moderate inhibitor of $\beta$ - $N$-acetylglucosaminidases with $\mathrm{IC}_{50}$ in the high micromolar range. The present work revealed that inversion of C-1 side chain in $\mathbf{1 1}$ to give $\mathbf{1 6}$ significantly enhanced its inhibition potency against these enzymes, pyrrolidine $\mathbf{1 6}$ demonstrating potent Jack bean $\beta-N$-acetylglucosaminidase inhibition, with a $\mathrm{IC}_{50}$ value of $3.4 \mu \mathrm{M}$. In contrast, replacement of the acetamide group by an amine as in $\mathbf{1 2}$ is detrimental to hexosaminidase inhibition (Table 1). It is noteworthy that pyrrolidine 11 showed low micromolar inhibition against bovine liver and E.coli $\beta$-glucuronidase, with $\mathrm{IC}_{50}$ values of 26 and $15 \mu \mathrm{M}$, respectively. Previous study suggested that $\beta$-glucuronidase recognized uronic acid and carboxylic acid part is required for tight binding. ${ }^{37,38}$ Thus, pyrrolidine $\mathbf{1 1}$ is an interesting case for $\beta$ glucuronidase inhibition.

In conclusion, a ring-contraction methodology applied to seven-membered iminosugars bearing an azido group in $\beta$ position furnished a low micromolar hexosaminidase inhibitor after conversion of the azide function into an acetamide and final deprotection. This work complements previous work on the conversion of polyhydroxylated azepanes into six-membered NHAc-homoiminosugars.

## 1. Experimental

### 1.1 Material and methods

All commercial reagents were used as supplied. Solvents (DMF, THF) were distilled under anhydrous conditions. TLC plates (Macherey-Nagel, ALUGRAM ${ }^{\circledR}$ SIL G/UV ${ }_{254}, 0.2 \mathrm{~mm}$ silica gel $60 \AA$ ) were visualized under 254 nm UV light and/or by dipping the TLC plate into a solution of 3 g of phosphomolybdic acid in 100 mL of ethanol followed by heating with a heat gun. Flash column
chromatography was performed using Macherey-Nagel silica gel $60(15-40 \mu \mathrm{~m})$. NMR experiments were recorded with a Bruker AM- 400 spectrometer at 400 MHz for ${ }^{1} \mathrm{H}$ nuclei and at 100 MHz for ${ }^{13} \mathrm{C}$ nuclei. The chemical shifts are expressed in part per million ( ppm ) using residual $\mathrm{CHCl}_{3}$ signal as internal reference $\left(\delta\left({ }^{1} \mathrm{H}\right)=7.26 \mathrm{ppm}\right.$ and $\left.\delta\left({ }^{13} \mathrm{C}\right)=77.16 \mathrm{ppm}\right)$ and the coupling constant $J$ in hertz (Hz). NMR multiplicities are reported using the following abbreviations: $\mathrm{b}=$ broad, $\mathrm{s}=$ singulet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quadruplet, $\mathrm{m}=$ multiplet. HRMS were recorded on a Bruker microTOF spectrometer, using Tuning-Mix as reference. Optical rotations were measured on a Perkin-Elmer 341 digital polarimeter or a Jasco P-2000 polarimeter with a path length of 1 dm .

## Highlights.

-A new family of amino-functionalised pyrolidines was synthesized.
-Aring-contraction of $\beta$-azido, $\gamma$-hydrox yazepanes was used.
-A low micromolar inhibitor of $\beta$ - N -acetylehexosaminidase identified.

## SUPPLEMENTARY INFORMATION

## Synthesis of pyrrolidine-based analogues of 2-acetamidosugars as N -acetyl glucosaminidase inhibitors
