#### Abstract

:

The most common fullerene member $\mathrm{C}_{60}$ displays many biological applications, such as, anticancer, human immunodeficiency virus and hepatitis C virus inhibitors, $\mathrm{O}_{2}$ uptake inhibitor and vectors for drug and DNA. Nevertheless, the innate hydrophobicity of $\mathrm{C}_{60}$ constrains its further development. We introduced cyclodextrins to enhance the water-solubility of $\mathrm{C}_{60}$. Nine cyclodextrin- $\mathrm{C}_{60}$ conjugates, including seven $\alpha$-cyclodextrin- $\mathrm{C}_{60}$ conjugates and two $\gamma$-cyclodextrin- $\mathrm{C}_{60}$ conjugates, were designed and synthesized. All of these conjugates did not show obvious cytotoxicity. The anti-influenza virus activity of nine conjugates was assessed. Two $\gamma$ -cyclodextrin- $\mathrm{C}_{60}$ conjugates, which were relatively more water-soluble, exerted higher inhibition with $\mathrm{IC}_{50}$ values of $87.73 \mu \mathrm{M}$ and $75.06 \mu \mathrm{M}$, respectively, than seven $\alpha$-cyclodextrin- $\mathrm{C}_{60}$ conjugates.

## 1. Introduction

Influenza is a common disease to both humans and animals. The respiratory diseases and secondary bacterial infection caused by influenza virus increase the lifethreatening risk, especially for elder people [1]. There are three types of influenza viruses, which are A, B and C. Influenza virus A is the major one to cause morbidity and mortality. Currently, two classes of anti-influenza drugs (neuraminidase inhibitors and M2 ion channel protein inhibitors) have been approved by the FDA for the interruption of specific processes in influenza infection. However, the emergence of drug-resistant influenza viruses has limited the use of those drugs, illustrating the urgent need to develop novel anti-influenza drugs $[2,3]$.
$\mathrm{C}_{60}$ serves as radical scavenger, reactive oxygen species (ROS) producer under irradiation, human immunodeficiency virus (HIV) and hepatitis C virus (HCV) inhibitors, $\mathrm{O}_{2}$ uptake inhibitor, drug and DNA vectors [4,5]. Nevertheless, its poor water-solubility limits the further development of $\mathrm{C}_{60}$. The functionalization of $\mathrm{C}_{60}$ not only ameliorates the water-solubility of $\mathrm{C}_{60}$, but also gives a possibility to discover new application of $\mathrm{C}_{60}$ in biology. Bis(phenethylamincuccinate) $\mathrm{C}_{60}(\mathbf{C 1})$ is firstly reported to inhibit HIV through interaction with the large hydrophobic pocket of HIV aspartic protease (Figure 1) [6]. Further study has shown that the modified $\mathrm{C}_{60}$ s with amino acid group ( $\mathbf{C} 2$ and $\mathbf{C 3}$ ) inhibit HIV reverse transcriptase and $\mathrm{C}_{60}$ derivatives with quaternary ammonium salts ( $\mathbf{C 4}$ and $\mathbf{C 5}$ ) have HCV RNA-dependent RNA polymerase inhibition activities [7]. Fmoc protected $\mathrm{C}_{60}$ derivative ( $\mathbf{C}$ ) exhibits potent HIV aspartic protease inhibition [8]. Echegoyen, Llano et al. have characterized the mechanism of $\mathrm{C}_{60}$ derivatives with quaternary ammonium salts in HIV inhibition. These derivatives prevent HIV-1 maturation with protease-independent way [25]. Even though some progress has been made by the aforementioned researches, the $\mathrm{C}_{60}$ derivatives with structural novelty and their mechanism in virus inhibition are still open issues. Based on these studies, we choose cyclodextrins (CDs) as functionalization groups to enhance the water-solubility of $\mathrm{C}_{60}$ and conduct research on other virus inhibition.

CDs, composed of 6,7 and 8 saccharides ( $\alpha-\mathrm{CD}, \beta-\mathrm{CD}$ and $\gamma-\mathrm{CD}$, respectively), are ideal candidates to improve the water-solubility of $\mathrm{C}_{60}$. Because of the relatively easy synthesis of $\beta$-CD derivatives, a lot of work was focused on $\beta$-CD- $\mathrm{C}_{60}$ conjugates and $\beta-\mathrm{CD} / \mathrm{C}_{60}$ micelle, which displayed photodynamic activity on DNA cleavage and HeLa cells inhibition [9-12, 15]. $\gamma$-CD with the largest cavity is capable to encapsulate $\mathrm{C}_{60}[13,16] . \gamma-\mathrm{CD} / \mathrm{C}_{60}$ complexes serve as photosensitizers and two $\gamma$-CD-C $\mathrm{C}_{60}$ conjugates generate the highest singlet oxygen compared to other $\mathrm{CD}^{-\mathrm{C}_{60}}$ conjugates [14, 16-19].

There is few studies on $\alpha$-CD- $\mathrm{C}_{60}$ conjugates and their biological applications in the literature. We previously reported that $\alpha$-CD-C $\mathrm{C}_{60}$ conjugate (C7) inhibits HCV entry into the host cells with $\mathrm{IC}_{50}$ value of $0.17 \mu \mathrm{M}$ [5]. In order to increase the family of $\alpha$-CD-C $\mathrm{C}_{60}$ conjugates, we designed and synthesized seven $\alpha$-CD-C $\mathrm{C}_{60}$ conjugates (Figure 2). However, these $\alpha-\mathrm{CD}^{2} \mathrm{C}_{60}$ conjugates did not display the promising inhibitory activity against HCV (unpublished data). Here we evaluated the anti-influenza A/WSN/33 (H1N1) virus activity of seven $\alpha$-CD-C 60 $_{60}$ conjugates and two reported $\gamma$-CD- $\mathrm{C}_{60}$ conjugates (Figure 2) [19].

As shown in Scheme 1, monol and diol of per- $O$-methylated CDs [20] were alkylated to obtain $\mathbf{5}$ and $\mathbf{8}$, respectively. Because -OH at position 2 is more acidic than position 6 and position 3, the alkylation condition of diol per- $O$-methylated CDs is milder than that of monol of per- $O$-methylated CDs . The remaining OH group of compound $\mathbf{8}$ was methylated to give compound 9 quantitatively. The alkylated compounds were converted to amino CD derivatives $\mathbf{6}$ and 9 . Then, 6 and 9 were coupled with $\left(\mathrm{HOOCR}_{2} \mathrm{OCO}\right)_{2} \mathrm{CH}_{2}$, which gave dimer $\mathbf{7}$ and $\mathbf{1 0}$, respectively. $\mathbf{7}$ and $\mathbf{1 0}$ were attached to $\mathrm{C}_{60}$, yielding $\mathbf{1}$ and $\mathbf{2}$ via Bingel-Hirsch cyclopropanation.

The $\alpha$-CD- $\mathrm{C}_{60}$ conjugates 3 and 4 with one $\alpha$-CD moiety were synthesized through the same methodology (Scheme 2). Since the condensed compounds $\mathbf{1 1 a}$ and 13a with -OH groups could not be attached to $\mathrm{C}_{60}$ directly, the free -OH groups of $\mathbf{1 1 a}$ and $\mathbf{1 3} \mathbf{a}$ were first methylated, before $\mathrm{C}_{60}$ was conjugated with $\mathbf{1 2 a}$ and $\mathbf{1 4 a}$ to afford 3 and 4, respectively.

Scheme 2. Synthetic routes of $\mathrm{CD}-\mathrm{C}_{60}$ conjugates 3 and 4. Reagents and conditions: (i) $\left(\mathrm{HOOC}\left(\mathrm{CH}_{2}\right)_{6} \mathrm{OCO}\right)_{2} \mathrm{CH}_{2}(1.0$ eq.), EDC HCl, HOBt, dry DCM, r.t., overnight; (ii) $\mathrm{CH}_{3} \mathrm{I}, \mathrm{NaH}$, dry DMF, $4 \AA$ M.S., r.t., overnight; (iii) $\mathrm{CBr}_{4}$, $\mathrm{DBU}, \mathrm{C}_{60}$, dry PhMe, r.t.

We estimated visually the water-solubility of nine conjugates at r.t., which was: $\mathbf{2 d}>\mathbf{1 d}>\mathbf{2 c}>\mathbf{2 a}>\mathbf{2 b}>\mathbf{1 a}>\mathbf{1 b}, \mathbf{3}, \mathbf{4}$. It was obviously inferred that $\gamma$-CD is a better water-solubilizing reagent than $\alpha-\mathrm{CD}$ and the hydrophilic linker at the secondary rim is beneficial to give water-soluble conjugate.

### 2.2 SAR of anti-influenza A/WSN/33 (H1N1) virus activity

As part of our biological profiling [21], a cytopathic effect (CPE) reduction assay and a CellTiter-Glo assay were utilized in parallel to evaluate the antiviral activity of nine CD- $_{60}$ conjugates ( $\mathbf{1 a - 1 b}, \mathbf{1 d}, \mathbf{2 a}-\mathbf{2 d}, \mathbf{3}, \mathbf{4}$ ) against the influenza A/WSN/33 (H1N1) virus that was propagated in MDCK cells [22]. Firstly, the CellTiter-Glo assay displayed that all tested compounds had no obvious cytotoxicity against uninfected MDCK cells at a concentration of $100 \mu \mathrm{M}$ (SI Figure 1). Then, the CPE reduction assay was carried out to screen the antiviral activity. All the conjugates were preliminarily tested at one concentration ( $100 \mu \mathrm{M}$ ) and oseltamivir (OSV), an inhibitor of influenza neuraminidase, was used as a positive control. As shown in Figure 3, all the $\alpha$-CD- C $_{60}$ conjugates had no anti-influenza virus activity at the concentration of $100 \mu \mathrm{M}$, except for compounds $\mathbf{1 d}$ and $\mathbf{2 d}$. These two $\gamma$-CD-C Con $_{60}$ conjugates $\mathbf{1 d}$ and $\mathbf{2 d}$ displayed significant anti-influenza virus activity ( 58.5 and $66.9 \%$, respectively) at $100 \mu \mathrm{M}$, which suggested that the $\mathrm{C}_{60}$ conjugates with $\gamma$-CD moieties were more effective than that with $\alpha$-CD moieties. Interestingly, 1 d and 2d had also higher water-solubility than seven $\alpha$-CD- $\mathrm{C}_{60}$ conjugates, indicating that the anti-influenza activity of CD-C $\mathrm{C}_{60}$ conjugates may relate to the watersolubility of the conjugates. Moreover, compared to $\alpha$-CD- $\mathrm{C}_{60}$ conjugates, $\gamma$-CD- $\mathrm{C}_{60}$ conjugates displayed much less aggregation in aqueous solution, which was evaluated by the generation of singlet oxygen species [19, 26]. The further work will focus on the design and synthesis of water-soluble CD-C $\mathrm{C}_{60}$ conjugates with less aggregation.

After the preliminary screening at one concentration, conjugates $\mathbf{1 d}$ and $\mathbf{2 d}$ were selected to undergo dose response assays. The concentrations of compounds $\mathbf{1 d}$ and $\mathbf{2 d}$ required to inhibit viral replication by $50 \%\left(\mathrm{IC}_{50}\right)$ are summarized in Table 1. Although conjugates $\mathbf{1 d}$ and $\mathbf{2 d}$ showed about half potent anti-influenza activity than that of OSV ( $\mathrm{IC}_{50}: 87.73$ and $75.06 \mu \mathrm{M}$ vs $33.6 \mu \mathrm{M}$, respectively), they can be used as new lead compounds of anti-influenza inhibitor for further structural modification.

## 3. Conclusion

We designed and synthesized nine $\mathrm{CD}^{-\mathrm{C}_{60}}$ conjugates. Cyclodextrin moieties enhanced apparently the water-solubility of $\mathrm{C}_{60}$. $\mathrm{CD}^{2} \mathrm{C}_{60}$ conjugates with $\gamma$ - $\mathrm{CD}^{2}$ attachment and hydrophilic spacer of moderate length are the most water-soluble. Then, their anti-influenza A/WSN/33 (H1N1) virus activity in MDCK cells was evaluated. All of the conjugates did not show obvious cytotoxicity at the concentration of $100 \mu \mathrm{M}$. The most water-soluble conjugates $\mathbf{1 d}$ and $\mathbf{2 d}$ displayed the highest anti-influenza virus activity. Although the inhibitory efficiency of $\mathbf{1 d}$ and $\mathbf{2 d}$ was only half of that of OSV, $\mathrm{C}_{60}$ derivatives are firstly reported to exhibit anti-influenza virus activity. According to our previous study, one of the obvious differences between $\alpha-\mathrm{CD}-\mathrm{C}_{60}$ conjugates and $\gamma$-CD-C $\mathrm{C}_{60}$ conjugates could be the less aggregation in aqueous solution of $\gamma$-CD- $\mathrm{C}_{60}$ conjugates [19, 26]. Further studies along this line are currently ongoing.

## General information

All of the reactants were purchased from commercial sources and used without further purification. DCM and PhMe were degassed, and dried on alumina using Pure SolvTM systems. DMF and $\mathrm{NEt}_{3}$ were dried over $4 \AA$ molecular sieve and stored under argon. HRMS were recorded on a Bruker microTOF spectrometer, using Agilent ESI-L Low Concentration Tuning-Mix as reference. NMR spectra were recorded on a Bruker AM-400 MHz or Bruker Avance II 600 MHz using the signal of the residual solvent as an internal reference. The NMR assignments were determined by COSY and HSQC experiments.

The synthetic protocols and the NMR assignments of $\gamma$-CD derivatives $\mathbf{1 d}$ and $\mathbf{2 d}$ were reported in our previous work [19].

4.2 Cytotoxicity test

Cells were seeded in 96 -well plates in DMEM supplemented with $10 \%$ FBS and cultured overnight at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$. Then the tested compounds were added and the cells were further incubated at $37{ }^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$ for 40 hours. Cell viability was assessed using the CellTiter-Glo assay kit as recommended by the supplier, and the plates were read using a plate reader (Tecan Infinite M2000 PRO; Tecan Group Ltd., Mannedorf, Switzerland) Viability was calculated using the backgroundcorrected absorbance as follows:
Viability (\%) = A of experiment well/A of control well $\times 100 \%$.
4.3 Cytopathic effect (CPE) reduction assay

The assay was performed as reported by Noah et al. with some modifications [24]. MDCK cells were seeded into 96 -well plates, incubated overnight and infected with influenza virus $(M O I=0.1)$ suspended in DMEM supplemented with $1 \% \mathrm{FBS}$, containing $2 \mu \mathrm{~g} / \mathrm{mL}$ TPCK-treated trypsin and tested compound, with a final DMSO concentration of $1 \%$ in each well. After incubation for 40 h , CellTiterGlo reagent (Promega Corp., Madison, WI, USA) was added and the plates were read using a plate reader (Tecan Infinite M2000 PRO ${ }^{\text {TM }}$; Tecan Group Ltd., Mannedorf, Switzerland).
