# Synthesis of novel photoluminescent pyridinium-betaine type molecules

3   **Ammar Hassoun ● Amina Benchohra ● Omar Khaled ● Dalila**

4   **Seghouane ● Jamal Moussa**⊠

6

7   **Abstract** A series of pyridinium-betaine like molecules has been reported;

8   one family of molecules is built with a benzimidazole core and a second

9   one with a pyrimidine moiety. The title compounds were prepared by

10   mixing   2-chlorobenzimidazole   or   2-bromopyrimidine   with   the

11   corresponding pyridines (pyridine, 4-*tert*-butylpyridine, 4-hydroxypyridine,

12   potassium   4-trifluoroboratepyridine,   4-dimethylaminopyridine)   in

13   acetonitrile or DMSO at high temperatures. The novel compounds were

14   characterized by spectroscopic methods. The UV-Vis. and fluorescence

15   features are reported as well. Preliminary photoluminescence results

16   showed broadband emissions as common feature ascribed to the

17   compounds containing benzimidazole ring. Some of the spectra nearly span

18   over the whole visible spectral range, which pave the way to real

19   opportunities to design single-component panchromatic emitters.

5

1    **Introduction**

2        Pyridinium-betaine dyes are a fascinating class of compounds,

3    especially due to their exceptional photophysical properties related to the

4    presence of low-lying intramolecular charge-transfer (CT) excited states.

5    [1-4] In particular, these compounds usually exhibit large negative

6    solvatochromism because of a dramatic reduction of the dipole moment

7    between the ground and the excited states; this has led to the development

8    of general methods for solvents polarity measurements.[5] An important

9    other feature is a large first-order hyperpolarizability and thus large non-

10   linear optical response resulting from the dipole moment change which

11   makes these molecules very attractive compounds for NLO applications.[6-

12   7]

13       On the other hand since the pioneering work by the groups of

14   Breslow,[8] Wanzlick[9] and Öfele[10] and the isolation of the first stable

15   metal free carbenes by Bertrand et al.[11] and Arduengo et al.[12] the

16   chemistry of N-heterocyclic carbenes has developed remarkably because of

17   their peculiar stereoelectronic properties especially their exceptional σ-

18   donor capacity in catalytically active metal complexes.[13] Meanwhile,

19   several classes of N-heterocyclic carbenes have been discovered, among

20   others pyridylidenes remain relatively unexplored as a result of tedious and

21   non-general synthetic methods of such species.[14-19]

1      Although the chemistry of N-heterocyclic carbenes (NHCs) and the

2      chemistry of heterocyclic mesomeric betaines (MB) have a common area,

3      there are very few compounds exhibiting both functionalities. Betaines are

4      molecules that can be represented by only one dipolar canonical formula in

5      which the positive and negative charges are delocalized within a common

6      $\pi$-electron system. There are several relationships that link the salts of *N*-

7      heterocyclic carbenes and mesomeric betaines, for instance interesting

8      results have been recently reported by Schmidtt et al. with pyridinium-2-

9      carboxylates that evolve to *N*-heterocyclic carbenes.[20]

10     We describe here a simple synthesis of pyridinium-betaine compounds in

11     the view to utilize them later as bidentate chelating *N^C* heteraryl-

12     pyridylidene ligands. The target compounds are shown in Figure 1; We

13     believe that this type of molecules represents a real opportunity for the

14     development of a new class of bidentate ligands exhibiting rare

15     pyridylidene centres combined with other nitrogen or heteroatom donors to

16     provide unprecedented transition metal complexes with multiple potential

17     applications in luminescent materials or catalysis for example. The

18     chemistry and the results of such compounds will be reported in the near

19     future and in the adequate journals.

3 scaffolds.

4

5 **Results and Discussion**

6 **Synthesis and characterization**

7 The synthetic routes leading to compounds **1-5** are depicted in scheme 1.

8 Treatment of 2-chlorobenzimidazole with an excess of pyridine in

9 acetonitrile under reflux and subsequent reaction work-up provided the

1  target molecule in good yield. The resulting compound is obtained upon

2  substitution of the chloride atom by pyridine and consists of a

3  benzimidazole moiety linked through the C2 carbon to the nitrogen of the

4  pyridine providing a pyridinum chemical structure. The unreacted 2-

5  chlorobenzimidazole crystalizes as white needles and is separated by

6  filtration on a sintered glass funnel. Then treatment with cesium carbonate

7  provided compound **1** reproductively in good yields. Identification of the

8  compound was unambiguously achieved by spectroscopic methods. For

9  instance, the $^1$H-NMR spectrum of 2-pyridinumbenzimidazole (**1**) in

10 $CD_3CN$ shows a series of signals in the aromatic region due to the protons

11 of the pyridinium and the benzimidazole moieties. A typical set of signals

12 of an AA'BB' system attributable to the benzimidazole protons is

13 observable at $\delta = 7.08$ ppm and $\delta = 7.57$ ppm, finally two triplets and one

14 doublets are visible at $\delta = 8.06$ ppm, $\delta = 8.48$ ppm and $\delta = 9.99$ ppm. This

15 compound was described in the literature using a different synthesis

16 method without NMR characterization.[21]
R = -H, t-Bu, NMe₂                    R = -H (**1**), -t-Bu(**2**), -NMe₂ (**5**)

R = -OH, -BF₃-                        R = -O (**3**), -BF₃ (**4**)

1

2    **Scheme 1:** Synthesis of the pyridinium-betaine molecules with the

3    benzimidazole core (**1-5**)

4          Under the reaction conditions for the preparation of compound **1**,

5    using 4-tert-butylpyridine instead of pyridine gave compound **2**. The

6    molecular weight of the target molecule was determined by mass

7    spectroscopy (252.1505 g.mol$^{-1}$) and further characterization by $^{1}$H- and

8    $^{13}$C-NMR spectroscopy confirmed the identity of the novel compound **2**.

9    (see experimental part for details).

10          Using 4-hydroxypyridne instead of pyridine or 4-tert-buthylpyridine

11   in these reaction conditions did not allow obtaining the target compound.

12   However using DMSO as solvent and under high temperature conditions,

13   in presence of sodium or caesium carbonate provided finally the desired

14   molecule **3** in good yield. Molecule **3** is a pyridone core linked through the

15   nitrogen to C2 carbon of the benzimidazole moiety. It was identified by

1    NMR and infrared spectroscopy techniques. The molecular weight of the

2    target molecule was determined by mass spectroscopy (234.0638 g.mol$^{-1}$).

3    (see experimental part for details). These reaction conditions using 4-

4    trifluoroboratepyridine instead of 4-hydroxypyridine but in absence of

5    carbonates provided the zwiterrion **4** in good yield. Identification of the

6    compound was unambiguously achieved by $^{1}$H- and $^{13}$C-NMR and infrared

7    spectroscopic methods. Evidence of the molecular weight of the molecule

8    emanates from mass spectroscopy (262.0761 g.mol$^{-1}$). (Structural details

9    are given in the experimental part)

10    The last molecule of this series is prepared by reaction 2-

11    chlorobenzimidazole with 4-dimethylaminopyridine using the experimental

12    conditions to prepare compound **3**. The target compound **5** is obtained in

13    good yield. The identity of the new compound was clearly ascertained by

14    $^{1}$H-NMR and infrared spectroscopic methods. Confirmation of the

15    molecular weight of the isolated molecule is obtained from mass

16    spectroscopy (239.1295 g.mol$^{-1}$).

17    We then decided to prepare analogous compounds of **1-5** exhibiting a

18    pyrimidine core instead of the benzimidazole moiety. The desired novel

19    compounds consist of a pyridinium moiety and a pyrimidine part that is

20    expected to be more electron-withdrawing than a benzimidazole ring which

21    might have a profound impact on the electronic properties of the target

1  final molecules and later on the metal complexes. The synthetic routes

2  leading to compounds **6-10** are depicted in scheme 2.

R = -H, t-Bu, NMe$_2$                           R = -H (**6**), -t-Bu(**7**), -NMe$_2$ (**10**)

3  R = -OH (+ Na$_2$CO$_3$), -BF$_3^-$                           R = =O (**8**), -BF$_3^-$ (**9**)

4      **Scheme 2:** Synthetic routes to the novel compounds **6-10** based on

5  the pyrimidine core

6      For instance when 2-bromopyrimidine is reacted with pyridine, the

7  pyridine nitrogen displaces the bromine atom; an interesting cationic

8  compound with a pyridinium core linked by the nitrogen atom to C2 carbon

9  of a pyrimidine moiety is obtained in good yield. The $^1$H-NMR spectrum of

10  compound **6** exhibits a set of signals in the aromatic region. A doublet at δ

11  = 9.12 ppm and a triplet at δ = 7.86 ppm are due to the pyrimidine moiety.

12  Four other multiplets are observed due to the pyridinium core. Additional

13  evidence of the molecular weight of the isolated molecule is given by mass

14  spectroscopy (158.0712 g.mol$^{-1}$).

1          Starting with 4-tert-butylpyridine and 2-bromopyrimidine

2    provided upon reaction workup compound **7** in good yield. Confirmation of

3    the molecular weight of the isolated molecule is given by mass

4    spectroscopy (214.1347 g.mol$^{-1}$). The identity of compound 7 was

5    confirmed by $^1$H-NMR, $^{13}$C-NMR and infrared spectroscopic methods.

6    (Structural details are given in the experimental part).

7          Similarly to the fist series with the benzimidazole moiety, reaction of

8    4-hydroxypyridine with 2-bromopyrimidine in acetonitrile did not offer the

9    target compound. However in the presence of sodium carbonate in hot

10   DMSO the target compound **7** was obtained in good yields. Additional

11   evidence of the molecular weight of the isolated molecule is given by mass

12   spectroscopy (196.0483 g.mol$^{-1}$). Compounds **9** and **10** were obtained

13   under similar reaction conditions in good yields.

14         Having prepared these two families of compounds we decided to

15   explore their absorption and emission properties since some of the

16   molecules seemed to be highly luminescent under the UV lamp.

17   Furthermore, as mentioned in the introduction we plan to use these

18   compounds as ligands with transition metals so such a study is relevant to

19   further comparison purposes.

20   **UV-Vis. absorption and emission properties**

10

1       The UV-Vis. spectra of all compounds were recorded in acetonitrile

2    solutions at C ≈ $10^{-5}$ M. Spectra of compounds of the first family with the

3    benzimidazole core are assembled in Figure 2. All spectra exhibit a high-

4    energy absorption band with high molar absorptivity molar values typical

5    of $\pi-\pi*$ transitions. Distinct additional charge transfer type transitions at

6    lower energy are visible for compounds **1**, **2** and **4**. The spectra of

7    molecules **3** and **5** don't seem to clearly exhibit such charge transfer

8    absorptions, maybe occurring at high energies thus overlapped with the

9    $\pi-\pi*$ transitions, tails on the high energy transitions are however visible.

10   These assignments are in good agreement with the experimental and

11   theoretical studies on the model compound **1**.[1a] In particular the authors

12   have shown  that the intramolecular charge transfer band in compound **1**

13   was hypsochromically shifted from toluene to THF and acetonitrile. We

14   have checked the charge transfer character of compounds **2** and **4** by

15   recording the UV-vis. absorption spectra in dichloromethane. Both

16   compounds **2** and **4** exhibited blue shifts from dichloromethane to

17   acetonitrile of 18 nm and 14 nm respectively. (The spectra are provided in

18   the supplementary section). Compounds **2-10** are not described in the

19   literature but the close similarity of the data with those of compound **1** are

20   in favour of the given assignments.

21
1

2    **Figure 2:** Absorption spectra of compounds **1-5** in acetonitrile

3         The UV-Vis. absorption spectra of compounds of the second family

4    with the pyrimidine core (**6-10**) recorded in acetonitrile are shown in

5    Figure 3 and the data are assembled in table 1. All spectra exhibit a high

6    energy absorption transition around 270 nm with high molar absorptivity

7    molar values typical of $\pi-\pi*$ transitions with the exception of compound

8    **10** which shows a significantly lower energy absorption at 320 nm. Within

9    this family no charge transfer type transitions are detectable.

**Figure 3:** Absorption spectra of compounds **6-10** in acetonitrile

**Table 1:** UV-Vis. absorption data for compounds **1-10**

|  | $\lambda_{abs}$ (nm) | $\varepsilon$ (mol$^{-1}$.L.cm$^{-1}$)x10$^4$ |
|---|---|---|
| **1** | 269; 392 | 2.47; 4.09 |
| **2** | 273; 388 | 8.11; 1.27 |
| **3** | 273 | 7.21 |
| **4** | 273; 355 | 7.29; 2.34 |
| **5** | 272 | 5.39 |
| **6** | 267 | 4.87 |
| **7** | 317 | 4.13 |
| **8** | 277 | 6.91 |
| **9** | 273 | 6.59 |
| **10** | 273 | 7.04 |

Photoluminescence spectra of all compounds were recorded in air equilibrated dichloromethane solutions at $C \approx 10^{-5}$ M. Compounds **6-10** did not exhibit any emission upon excitations in the 300-340 nm. In stark contrast, solutions of compounds **1-5** exhibit relatively intense emissions upon excitation wavelengths in the range 350-400 nm. The spectra are

1    presented in figure 4. These data are only qualitative since our goal is to

2    use these compounds to prepare pyridylidene metal complexes as

3    mentioned in the introduction. The parent compound **1** was found to exhibit

4    an emission at $\lambda_{max}$= 687 nm in acetonitrile with a blue shift in THF

5    solution at $\lambda_{max}$ = 675 nm and in toluene at $\lambda_{max}$ = 669 nm, we found this

6    emission to be at $\lambda_{max}$ = 647 nm in dicholormethane solution at room

7    temperature. Molecule **2** exhibits a similar emission band at $\lambda_{max}$ = 627 nm

8    in dichloromethane slightly blue shifted in comparison to the parent

9    compound **1** due to presence of the tert-butyl- group. The pyridone

10   derivative **3** has an interesting UV-blue emission while compounds **4** and **5**

11   exhibit very unusual broad emission bands covering a wide region of the

12   visible spectrum (400-680/690 nm). These unusual broad emission bands

13   seem to be the result of a dual emission which make these molecules

14   interesting candidates to design single-component panchromatic emitters.

15       To make sure that emissions do not arise from small highly emitting

16   impurities, the excitation spectrum has been recorded in the excitation

17   wavelengths range and fits well to the absorption spectrum in each case.

18   White-light emission from a single component is quite rare in the literature;

19   discovery of powerful molecules in this field would be of real application

20   potential in lightening devices. Such behaviour in compounds **4** and **5** is

21   very peculiar, as far as we are aware there is very few examples displaying

1   white   light   emission   from   a   single-component   described   in   the

2   literature.[22-23] White light emission is usually obtained by combination

3   of three different components (blue, green and red emitters), which makes

4   the devices preparation and durability a complicated task.[24-26]
5

6   **Figure 4:** Photoluminescence spectra of compounds **1-5** in air equilibrated

7   dichloromethane solutions.

8

9          We believe that detailed spectroscopic and theoretical investigations

10   will be conducted in the future to unravel the properties of the excited

11   states involved in these processes in order to understand the fundamental

12   and crucial parameters to be controlled to lead to the discovery of very

13   useful molecules with panchromatic emission properties.

1

2  **Conclusion**

3  In this work we set up general procedures to prepare two families of

4  betaine like molecules based on benzimidazole or pyrimidine cores.

5  Heating 2-chlorobenzimidazole or 2-bromopyrimidine with an excess

6  of the corresponding pyridine (pyridine, 4-tert-butylpyridine, 4-

7  hydroxypyridine,           4-trifluoroboratepyridine           or           4-

8  dimethylaminopyridine) in acetonitrile or dimethylsulfoxyde provides

9  the target molecules in good to high yields. Identification of the

10  compound was unambiguously achieved by spectroscopic methods

11  and the molecular weight was confirmed by mass analyses.

12  Furthermore, we have reported the UV-Vis. Absorption and emission

13  properties of the new molecules **1-10**. Compounds of the pyrimidine

14  core family are not emissive in air equilibrated dichloromethane

15  solutions nor in the solid state but interesting photoluminescence

16  results are obtained for the benzimidazole-based family (**1-5**). In

17  particular some of the molecules clearly show a dual emission

18  behaviour that make them emitting nearly over the whole visible

19  spectral range providing a unique opportunity to design single-

20  component white light emitting materials with great potential in the

21  lighting technology. As an interesting perspective we believe that

1    these novel betainoid molecules may act as singular bidentate

2    pyridylidene ligands for transition metal complexes. We will

3    investigate their coordination properties in the near future and the

4    results will be published in due course.

5    **Experimental**

6    **Materials and Methods**

7        All experimental manipulations were carried out under an argon

8    atmosphere by using Schlenk tube techniques. Solvents were dried and

9    distilled under argon by standard procedures. All reagents obtained from

10   commercial sources were used as received. The $^1$H and $^{13}$C NMR spectra

11   were recorded in $CD_3CN$ using a Bruker Avance 300 NMR spectrometer at

12   300.13 MHz, and 75.47 MHz respectively. IR spectra were recorded on a

13   Bruker Tensor 27 equipped with an ATR Harricks apparatus. UV-Vis.

14   spectra were recorded on a *JASCO V-670* Spectrometer.

15   Photoluminescence spectra were recorded using a *JASCO J-815 CD*

16   Spectrometer. Mass spectrometric analyses of compounds **2**, **4**, **5**, **7**, **9**, and

17   **10** were performed on a microTOF Bruker mass spectrometer (ESI-TOF).

18   These compounds were performed in methanol by direct infusion with the

19   ESI-source set at 180°C and a capillary voltage set at 4500 VMass

20   spectrometric analyses of compounds **3**, **8** and **6** were performed on a  LTQ

21   Orbitrap high-resolution (Thermo). These compounds were dissolved in

1  methanol and analyzed by direct infusion with the positive mode

2  Electrospray (ESI) source set at 275°C and a capillary voltage set at 20 V.

3

4  **Compound 1**, 2-pyridiniumbenzimidazolate: 2-chlorobenzimidazole (250

5  mg, 1,64 mmol) and anhydrous pyridine (1 mL) were placed in a Schlenk

6  tube and acetonitrile (20 ml) was added. The mixture was refluxed under an

7  atmosphere of argon at 100 °C for 48h. Then cooling the solution results in

8  the precipitation of unreacted 2-chlorobenzimidazole as white crystalline

9  needles that can be recovered on a sintered glass funnel. The filtrate is then

10  evaporated to dryness and to the oily residue is added anhydrous diethyl

11  ether (50 mL), a light-yellow solid formed and was recovered and

12  dissolved in methanol in presence of $Cs_2CO3$ for 30 minutes. After

13  evaporation to dryness, the solid residue was extracted with

14  dichloromethane (3x15 mL), upon filtration through celite and evaporation

15  of the volatiles; a yellow solid is obtained (288 mg, 1,47 mmol). Yield: 89

16  %.

17     IR (neat ATR Harricks, cm$^{-1}$): 3064, 2923, 1683, 1627, 1524, 1481,

18  1434, 1352, 1334, 1315, 1269, 1158, 1072, 1040, 952, 879, 856, 813, 742,

19  674, 615, 595, 551, 522, 503, 429, 376, 357, 309.

1     $^1$H NMR (300.13 MHz, CD$_3$CN): $\delta$ = 10.00 (d, 2H, $^2J$ = 6.9 Hz, H$_\alpha$

2     pyridinium), 8.42 (t, 1H, $^2J$ = 7 Hz, H$_\beta$ pyridinium), 8.03 (dd, 2H, $^2J$ = 7

3     Hz, H$_\beta$ pyridinium), 7.54 (dd, 2H, $^2J$ = 9.0 Hz, $^3J_{H-H}$ = 2.7 Hz, H$_\beta$

4     benzimidazol), 7.04 (dd, 2H, $^2J$ = 9.0 Hz, $^3J_{H-H}$ = 2.7 Hz, H$_\alpha$ benzimidazol).

5     $^{13}$C{-$^1$H} NMR (75.47 MHz, DMSO-$d_6$) $\delta$ = 124.4, 128.1, 141.8, 145.3,

6     149.1,150.9.

7     Anal. Calcd. For C$_{12}$H$_9$N$_3$ (195.2 g.mol$^{-1}$): C, 73.83; H, 4.65; N,

8     21.52. Found: C, 74.31; H, 4.37; N, 21.11.

9

10    **Compound        2,**        2-4-*tert*-butylpyridiniumbenzimidazolate:        2-

11    chlorobenzimidazole  (540  mg,  3,54  mmol)  and  anhydrous  4-*tert*-

12    butylpyridyl (1 mL) were placed in a Schlenk tube and acetonitrile (20 ml)

13    was added. The mixture was refluxed overnight under an argon atmosphere

14    at 100 °C. Then cooling the solution resulted in the precipitation of

15    unreacted 2-chlorobenzimidazole as white crystalline needles that can be

16    recovered on a sintered glass funnel. The filtrate is then evaporated to

17    dryness and to the oily residue is added anhydrous diethyl ether (50 mL),

18    this precipitate and anhydrous Cs$_2$CO$_3$ (219 mg) were placed in a Schlenk

19    tube and methanol (20 ml) was added. The mixture was stirred under an

20    atmosphere of argon at room temperature for two hours. The solvent is then

1  evaporated under reduced pressure. The residue is extracted with

2  dichloromethane (50 mL), compound **2** is obtained as a yellow crystalline

3  solid (553 mg, 2,2 mmol). Yield: 62 %.

4      IR (neat ATR Harricks, cm$^{-1}$): 3420, 3026, 2958, 1632, 1608, 1555,

5  1497, 1465, 1445, 1393, 1366, 1306, 1267, 1193, 1123, 1104, 1044, 1001,

6  963, 868, 810, 737, 667, 622, 566, 451, 415.

7      $^1$H NMR (300.13 MHz, DMSO): $\delta$ = 9.86 (d, 2H, $^2J$ = 6.9 Hz, H$_\alpha$

8  pyridynium), 8.16 (d, 2H, $^2J$ = 6.9 Hz, H$_\beta$ pyridynium), 7.48 (dd, 2H, $^2J$ =

9  9.0 Hz, $^3J_{\text{H-H}}$ = 2.7 Hz, H$_\beta$ benzimidazol), 6.95 (dd, 2H, $^2J$ = 9.0 Hz, $^3J_{\text{H-H}}$ =

10  2.7 Hz, H$_\alpha$ benzimidazol), 1.42 (s, 9H, CH$_3$ *tert*-butyl). $^{13}$C{-$^1$H} NMR

11  (75.47 MHz, DMSO-$d_6$) $\delta$ = 30.0, 36.7, 117.8, 119.9, 125.1, 138.8, 146.9,

12  170.1.

13      HRMS - m/z calcd. for [C$_{16}$H$_{18}$N$_3$+H]$^+$ 252.1495; found. 252.1505.

16  **Compound 3,** 2-4-*N*-pyridinone-1*H*-benzimidazole**:** 2-

17  chlorobenzimidazole (250 mg, 1,64 mmol), with sodium carbonate (190

18  mg, 0.59 mmol) and anhydrous hydroxypyridine (170 mg, 1,79 mmol)

19  were placed in a Schlenk tube and dimethyl sulfoxide (2 ml) was added.

20  The mixture was heated under an atmosphere of argon at 140 °C for 24h.

1    The solvent is evaporated under vacuum, and the product is precipitated by

2    addition of 30 ml of DCM. The mixture is then sintered from porosity 4

3    and then washed with 2x15mL diethyl ether. A brownish solid is obtained

4    (145 mg, 0.64 mmol). Yield: 42%.

16

17  **Compound 5,** 2-4-N,N-dimethylaminopyridiniumbenzimidazole: 2-

18  chlorobenzimidazole (250 mg, 1.64 mmol), and 4-dimethylaminopyridine

19  (250 mg, 2.04) were placed in a Schlenk tube and dimethyl sulfoxide (2

20  ml) was added. The mixture was heated under an atmosphere of argon at

1   140 °C for 24h. The solvent is evaporated under vacuum, and the product is

2   precipitated by addition of 30 ml of diethyl ether. The mixture is then

3   filtered on sintered porosity is 4 and then washed with 2x15 mL $Et_2O$. This

4   precipitate and anhydrous $Na_2CO_3$ (120 mg) were placed in a Schlenk tube

5   and methanol (20 ml) was added. The mixture was stirred under an

6   atmosphere of argon at room temperature for two hours. The solvent is then

7   evaporated under reduced pressure. The residue is extracted with

8   dichloromethane (50 mL). Compound **5** is obtained as a yellow crystalline

9   solid (260 mg, 0.95 mmol). Yield: 58 %.

10      IR (neat ATR Harricks, $cm^{-1}$): 1649, 1582, 1536, 1434, 1410, 1270,

1    Graphical abstract

2    A series of pyridinium-betaine like molecules has been reported. The title

3    compounds were prepared by mixing 2-chlorobenzimidazole or 2-

4    bromopyrimidine with the corresponding pyridines (pyridine, 4-*tert*-

5    butylpyridine, 4-hydroxypyridine, potassium 4-trifluoroboratepyridine, 4-

6    dimethylaminopyridine). Preliminary photoluminescence results showed

7    that some of the compounds could behave as single-component

8    panchromatic emitters.
