32 **Key words:** psoriasis, biological agents, PASI, quality of life, registry

1 **Funding:** The PsoBioTeq cohort study is supported by unrestricted research grants from the  
 2 French Ministry of Health (PHRC AOM 09 195), the French National Drug and Healthcare  
 3 Products Safety Agency (ANSM) and private funders (Abbvie, Janssen, Pfizer, MSD France,  
 4 Lilly France, Novartis Pharma, Celgene and Leo Pharma). The PsoBioTeq cohort study is  
 5 based on a multistakeholder industrial partnership, at the request of the French High Authority  
 6 for Health (HAS, Haute Autorité de Santé). The study was sponsored by the Centre for  
 7 Clinical Research and Innovation (DRCI, AP-HP, Direction de la Recherche Clinique et de  
 8 l'Innovation, Assistance Publique–Hôpitaux de Paris). The PsoBioTeq cohort was set up  
 9 under the auspices of the French Society of Dermatology (SFD) and its Psoriasis Study  
 10 Group. None of the private funders had any role in the design of this ancillary study, data  
 11 management, analysis and interpretation of the data, preparation or approval of this  
 12 manuscript, or the decision to submit it for publication. They received the manuscript for  
 13 information purposes before submission.

14 **Conflict of interest disclosures**

15 M. Beylot-Barry is a consultant for Abbvie, Celgene, Janssen-Cilag, Lilly, Novartis, Medac  
 16 and UCB.

17 J. Seneschal is a consultant for Abbvie, Celgene, Janssen-Cilag, Lilly and Novartis.

18 O. Chosidow is the principal investigator of the PsoBioTeq cohort, supported by unrestricted  
 19 research grants from the French Ministry of Health (PHRC AOM 09 195), the ANSM,  
 20 Abbvie, Janssen, Pfizer and MSD France, and did not receive any personal remuneration from  
 21 these companies.

22 F. Tubach is head of the Pharmacoepidemiology Centre of the AP-HP and of the Clinical  
 23 Research Unit of Pitié-Salpêtrière Hospitals; both these structures have received unrestricted  
 24 research funding, grants and consultancy fees from a large number of pharmaceutical  
 25 companies, that have contributed indiscriminately to the salaries of its employees. F. Tubach  
 26 did not receive any personal remuneration from these companies.

27 N. Beneton is a consultant for Novartis, Celgene, MSD, Janssen, Lilly, Pfizer and Abbvie.

28 P. Joly is a consultant for Abbvie, Celgene, Janssen-Cilag, Lilly and Novartis.

29 D. Jullien is a consultant for Abbvie, Amgen, Celgene, Fresenius-Kabi, Janssen-Cilag, Leo,  
 30 Lilly, Pfizer, MEDAC, Novartis and UCB.

31 E. Mahé is a consultant for Abbvie, Leo Pharma, Celgene, Pfizer, Janssen-Cilag and Novartis.

32 C. Paul is a consultant for Abbvie, Almirall, Amgen, Boehringer, Celgene, Janssen-Cilag,  
 33 Leo, Lilly, Pfizer, Novartis, Pierre Fabre, Sanofi and UCB.

34 M.A. Richard is a consultant for Abbvie, Amgen, Boehringer, Celgene, Janssen-Cilag, Leo  
 35 Pharma, Lilly, Nordic, Novartis, Pfizer and Medac.

36 H. Bachelez is a consultant for Abbvie, Almirall, Amgen, Biocad, Boehringer, Celgene,  
 37 Dermavant, Janssen, Leo Pharma, Eli-Lilly, Mylan, Novartis, Pfizer, Pierre Fabre, Sun  
 38 Pharmaceuticals and UCB.

39 H. Bachelez is a consultant for Abbvie, Almirall, Amgen, Biocad, Boehringer-Ingelheim,  
 40 Celgene, Dermavant, Kyowa-Kirin, Janssen, Leo Pharma, Eli-Lilly, Mylan, Novartis, Pfizer,  
 41 UCB, Xion Pharmaceuticals.

42 A. Dupuy and E. Sbidian have no funding or conflicts of interest to disclose.

43 **Ethics :** The PsoBioTeq study was approved by the 'Comite d 'Evaluation de l'Ethique des  
 44 Projets de Recherche Biomedicale (CEERB) du GHU Nord' [Institutional Review Board  
 45 (IRB) of Paris North Hospitals, Paris 7 University, AP-HP], (authorization No.  
 46 JMD/MDM/177-11) and was registered on Clinical Trials.gov under the reference  
 47 NCT01617018.

48 **Acknowledgments:** we would like to thank Andrew Cowderoy for editing the manuscript ;  
 49 Nessima Yelles, Sarra Pochon, Hadia Hafirassou, from the Pharmacoepidemiology Centre of

1 the AP-HP for the implementation, management and monitoring of the study, and Yann De  
2 Rycke for data management and statistical analysis coordination.

3  
4 Dear Editor,

5 The decision to initiate systemic therapy in psoriasis is based mainly on disease severity  
6 assessments, determined using physicians-derived scores. A commonly used assessment is the  
7 Psoriasis Area and Severity Index (PASI), with an absolute value of 10 or more indicating  
8 severe disease.<sup>1</sup> How patients perceive the severity of psoriasis and physicians' evaluations  
9 may be discordant, especially when lesions involve visible areas or are associated with  
10 itching. Such lesions can have a greater impact on quality of life (QoL),<sup>2</sup> as evaluated using  
11 patient-reported outcomes such as the Dermatology Life Quality Index (DLQI). Analysis of  
12 the Swedish PsoReg registry found that patients with high PASI and low DLQI were more  
13 likely to receive biologics than those with low PASI and high DLQI.<sup>3</sup> A retrospective study of  
14 54 patients showed that DLQI guides therapeutic decisions in patients with PASI  $\leq 6$ , with  
15 improvement of both disease and QoL scores following systemic therapy.<sup>4</sup> A recent  
16 international Delphi consensus challenged the severity criteria,<sup>5</sup> and guidelines<sup>1,6</sup> propose  
17 considering systemic therapy when psoriasis involves impactful areas or is recalcitrant to  
18 topical therapy, whatever the PASI.

19 To understand better the determinants of clinical decisions other than disease severity, we  
20 aimed to describe the clinical profiles and main outcomes of patients with PASI <10 for  
21 whom biologics were initiated in the real-life French PsoBioTeq cohort.<sup>7</sup> The PsoBioTeq  
22 study was approved by the 'Comite d'Evaluation de l'Ethique des Projets de Recherche  
23 Biomedicale du GHU Nord' (JMD/MDM/177-11) and was registered on Clinical Trials.gov  
24 (NCT01617018).

25 Between July 2012 to July 2016, 1027 patients initiated biologics and had available PASI data  
26 at inclusion. We compared patients with PASI <10 vs.  $\geq 10$  for baseline variables (socio-

1 demographic data, choice of biologic, type and location of psoriasis, PASI and DLQI,  
2 treatment response and drug survival. Descriptive analysis used n (%), mean (SD) and  
3 survival curves with the Kaplan-Meier method. Groups were compared using the chi-squared,  
4 Fisher, Student's t or log-rank test, as appropriate.

5 Table 1 presents the characteristics of the 1027 patients. Among them, 403 (39.2%) had PASI  
6 <10. We found no difference between groups for age and socioprofessional categories.  
7 Women more frequently had PASI <10 (43.4% vs. 32.2%,  $p < 0.001$ ). Body mass index also  
8 differed, with obese patients less often having PASI <10 (25.3% vs. 34.6%,  $p=0.01$ ). In the  
9 whole cohort, 91.4% of patients presented plaque-type psoriasis, without any difference  
10 between PASI groups. Psoriasis restricted to visible areas (face, palms, nails, folds) was most  
11 frequent in the PASI <10 group (5.0% vs. 1.2%,  $p<0.001$ ). DLQI >10 was more frequent in  
12 the PASI  $\geq 10$  group (52.0% vs. 33.8%). However, 52.7% of the 256 patients with a very low  
13 PASI (0-6) had DLQI > 10.

14 Before initiating biologics, 90.7% of all study patients received at least one systemic  
15 conventional treatment. The two most frequently prescribed first-line biologics in the cohort  
16 were adalimumab and ustekinumab, with a different distribution between the 2 groups  
17 (adalimumab 36.0% vs. 45.7%; ustekinumab 32.8% vs. 27.2% in PASI <10 and  $\geq 10$  groups,  
18 respectively).

19 Biologic drug survival did not differ significantly across the two PASI groups: median  
20 survival 23.2 months (range 19.3-27.9) in the PASI <10 group and median 27 months (range  
21 23.1-31.8) in the PASI  $\geq 10$  group ( $p=0.23$ ). Time to achieve  $\geq 75\%$  reduction of baseline  
22 PASI was significantly delayed in the PASI <10 group: median time of 12.2 months (range  
23 10.2-14.0) vs 6.7 months (range 6.3-7.1);  $p<0.001$ . Time to achieve a DLQI of 0 or 1 did not  
24 statistically differ between the two groups ( $p=0.13$ ).

1 In conclusion, we found that 39% of patients in the PsoBioTeq cohort in whom biologics  
2 were initiated had PASI <10 at initiation. This was not the consequence of a high frequency  
3 of non-plaque-type psoriasis, such as palmo-plantar pustulosis, for which PASI is not  
4 appropriate. The main differences between patients from the two groups were that patients  
5 with PASI <10 were more frequently women and not obese and had higher-frequency  
6 involvement of impactful areas. Such localisations have a known impact on social well-  
7 being.<sup>2</sup> One third of these patients reported a significant impact on QoL (DLQI >10), and this  
8 reached 52.7% in the low-PASI (0-6) subgroup. These characteristics might explain the  
9 decision to start biologics in some of these patients, even if the PASI score was low.  
10 Therapeutic maintenance was favorable in the PASI<10 group, although no formal  
11 comparison can be made with the PASI > 10 group due to differences in therapeutic regimen  
12 between the two groups.

13 Altogether, this study is in accordance with increasing evidence that, in addition to PASI, the  
14 decision to initiate biologics considers patient-specific treatment goals, especially for  
15 impactful skin sites, with lack of disease control under conventional treatments.<sup>5,6,8</sup> More data  
16 are needed to address the needs of patients with limited disease severity and high impact of  
17 psoriasis on QoL to plan for appropriate therapeutic intervention.
