HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Role of MuscleBlind-Like proteins in the regulation of expression of CaVβ1 isoforms in adult skeletal muscle

A. Vergnol¹, A. Sureau¹, M. Traoré¹, X. Lornage¹, G. Gourdon¹, D. Furling¹, F. Pietri-Rouxel^{1*} and S. Falcone^{1*}

CaVβ1-E/GDF5 axis in muscle mass homeostasis

INTRODUCTION

Cacnb1 isoforms in skeletal muscle

Implication of MBNLs in DM1 pathophysiology

Voltage-gated calcium channels (CaVs or VGCCs) are major regulators of calcium-related cellular functions. In skeletal muscle, though the essential component of the pore channel is the CaVα1 subunit, the CaVβ1 subunit is an essential subunit guaranteeing CaV fine-tuning activity. CaVβ1-E and CaVβ1-D are two different isoforms of CaVβ1 protein in skeletal muscle, expressed during embryogenesis and in healthy innervated adult muscle, respectively. Importantly, our recent study demonstrated that the embryonic CaVβ1-E expression increases after a nerve damage in adult skeletal muscle and enables the expression of GDF5 (Growth Differentiation Factor 5) to counteract excessive muscle wasting (Traoré et al. 2019). However, the mechanisms leading to the increase in CaVβ1-E expression are unknown to date. Our RNAseq data analysis in innervated versus denervated muscles revealed MuscleBlind-Like (MBNL) proteins as potential candidates regulating CaVβ1 expression in skeletal muscle. Interestingly, in a human model of Dystrophy Myotonic 1 (DM1), the sequestration of MBNLs in toxic nuclear aggregates is related to an impaired splicing of CaVβ1 transcript (CACNB1) (Arandel et al. 2017). Here, we evaluate the effect of a modulation of MBNLs protein levels on the expression of CaVβ1 isoforms in both *in vitro* and *in vivo* systems as well as in pathological mouse models of DM1.

Correlation between MBNLs and Cacnb1 expressions

Mouse model of Mbn1 downregulation

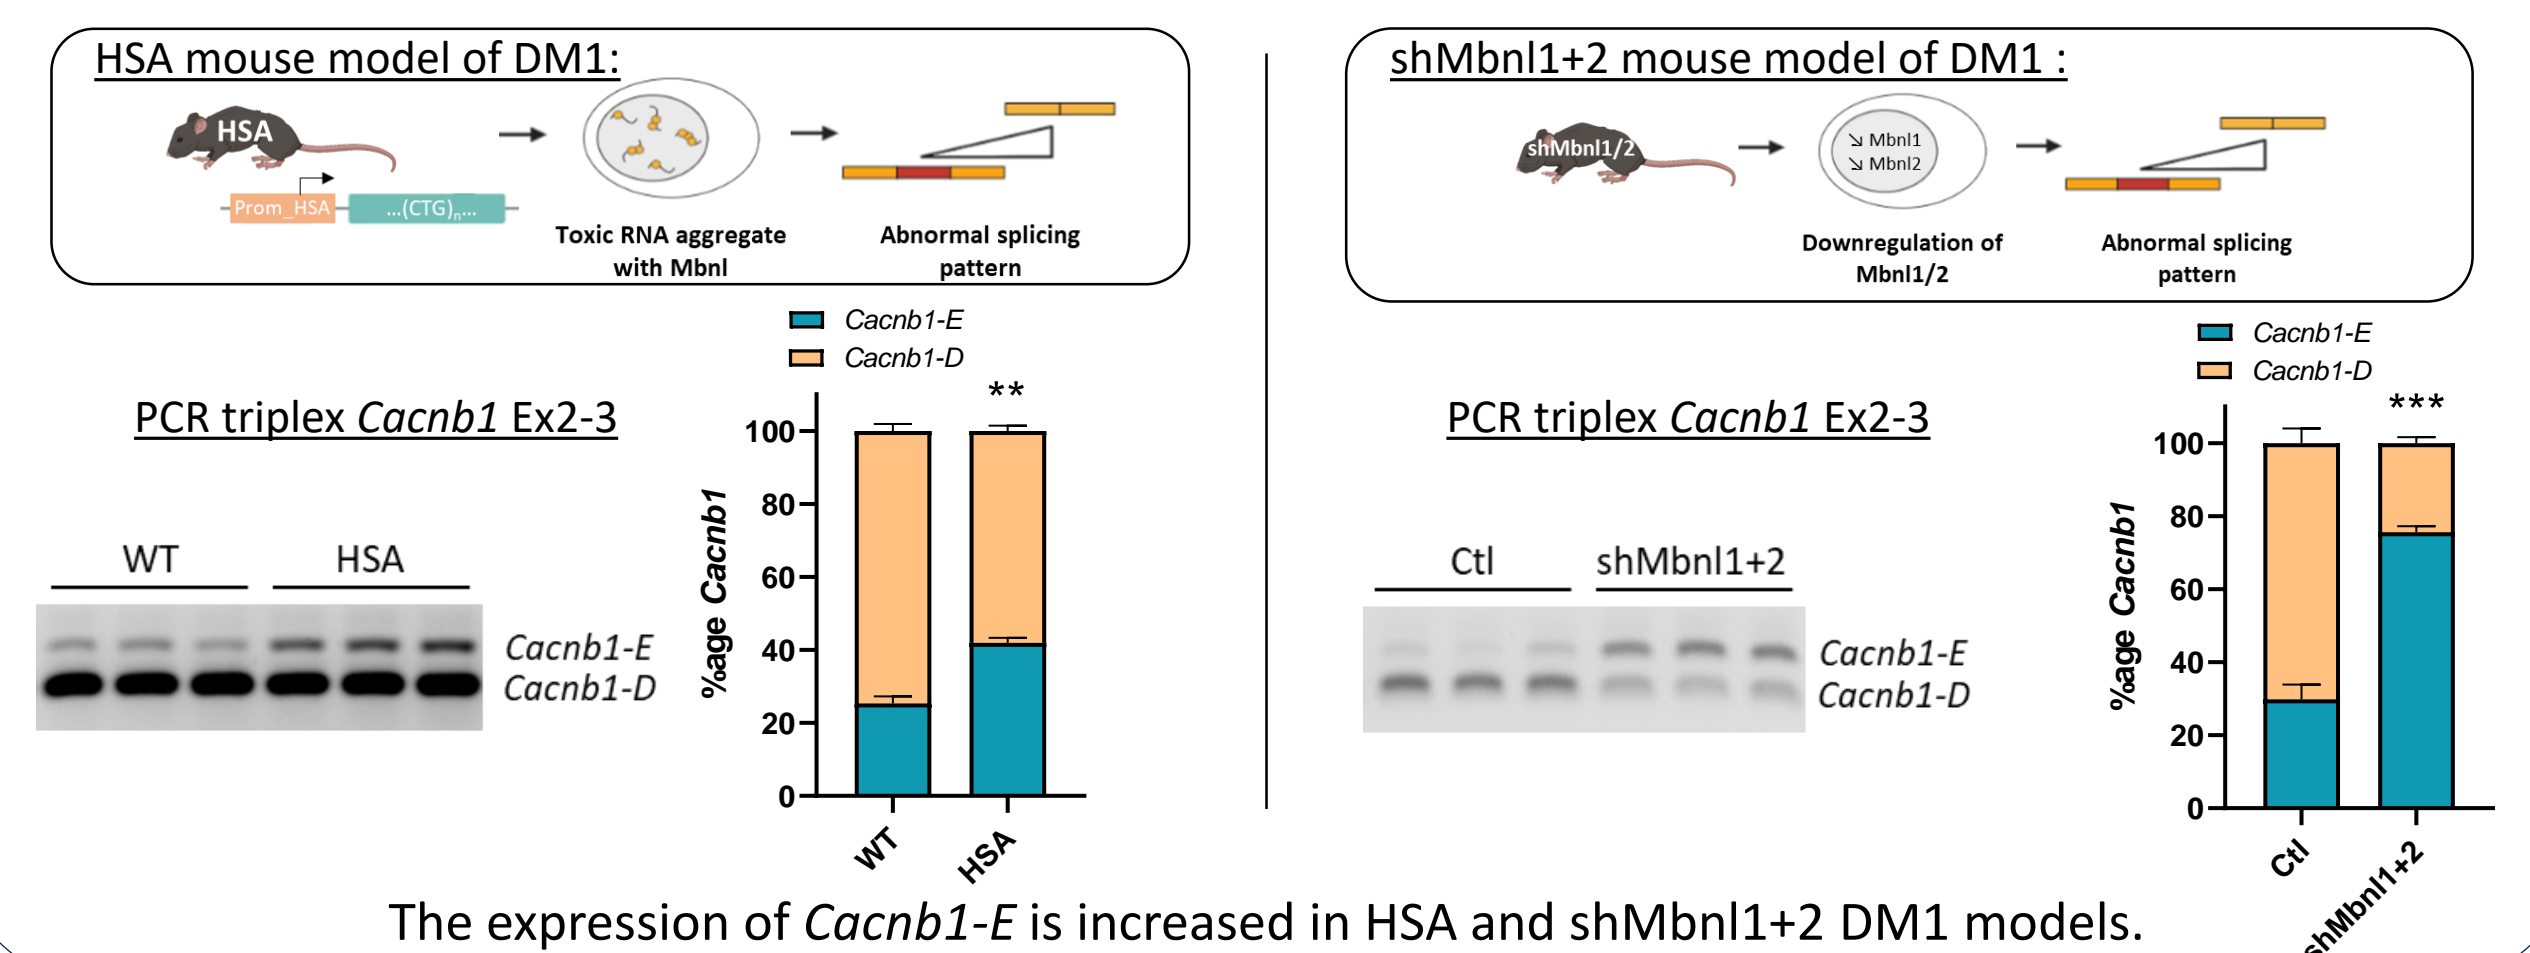

MBNLs modulates the expression of CaVβ1 isoforms in vivo

MBNLs impacts Cacnb1 mRNA stability

Cacnb1-E increases in DM1 pathological models

CONCLUSIONS & PERSPECTIVES

- *Mbn1* negatively regulates *Mbn3*
- Downregulation of *Mbn1* *in vivo* is associated with impaired muscle and neuromuscular functions
- A downregulation of *Mbn1*, associated with an increase of *Mbn3*, leads to increased CaVβ1-E and decreased CaVβ1-D expression levels *in vivo*
- *Cacnb1* transcripts stability is modulated by MBNLs *in vitro* through their 3'UTR
- Mouse models of DM1 are associated with an increased *Cacnb1-E* expression

- Characterization of the splicing events occurring at *Cacnb1* Ex2-3 and Ex13-14
- Studying a potential cross-regulation of CaVβ1-D on CaVβ1-E expression
- Deciphering the role of CaVβ1-E in DM1 pathophysiology
