HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Unraveling the role of GDF5 therapeutic potential in Amyotrophic Lateral Sclerosis

Piétri-Rouxel^{*1}. ¹Sorbonne Université, INSERM, Institut de Myologie, Centre de Recherche en Myologie, F-75013 Paris, France; ^{+;} * Equally contributed

Muscle denervation is a common hallmark of several neuromuscular diseases and accounts for skeletal muscle atrophy and dysfunction associated to their pathophysiology. In non-pathologic muscle, the induction of GDF5/SMAD1/5 pathway is essential for avoiding excessive atrophy but also for promoting re-innervation after nerve damage. Recently, we demonstrated that alterations of GDF5 pathway can be implicated in human and mouse age-related muscle wasting and that its overexpression prevents muscle mass loss and force decline during ageing in mice. SMAD1/5 pathway activation has been described as beneficial for motor neuron dysfunction in an Amyotrophic Lateral Sclerosis (ALS) model. We thus hypothesize that GDF5 implementation could have a positive impact on pathophysiology of the disease. We propose a strategy potentially applicable to different ALS forms and/or to optimize gene therapybased approaches.

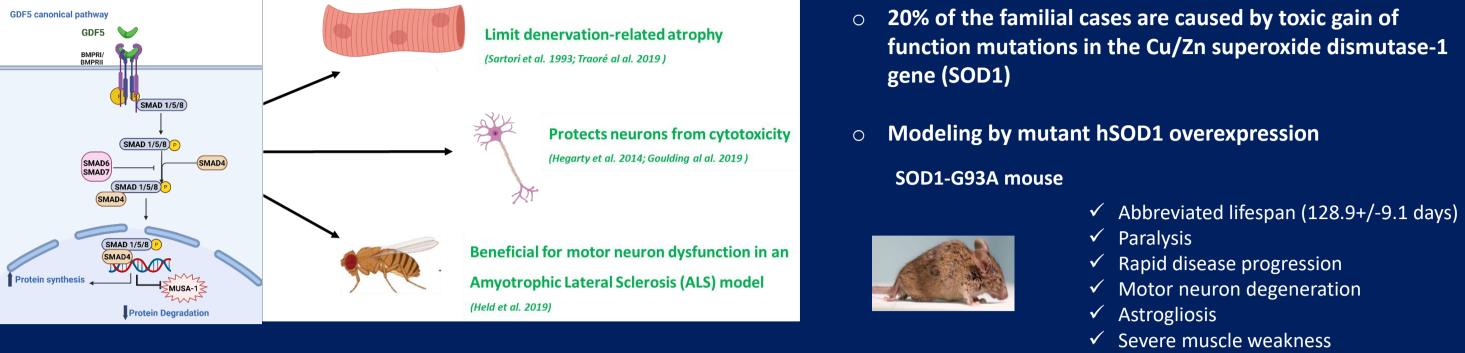

Force generation of GDF5 overexpressing SOD^{G93A} mice

ALS

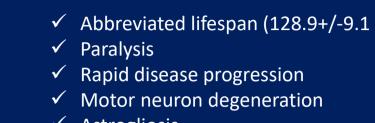

- The most common adult-onset motor neuron disorder (1-4 per 100.000 live birth per year)
- 90% sporadic forms, 10% familial forms
- Very rapid progression: death often occurs within 3 5 years of diagnosis
- Multifactorial pathophysiological mechanisms
- No cure: More than 50 negative randomized controlled clinical trials in the past 50 years

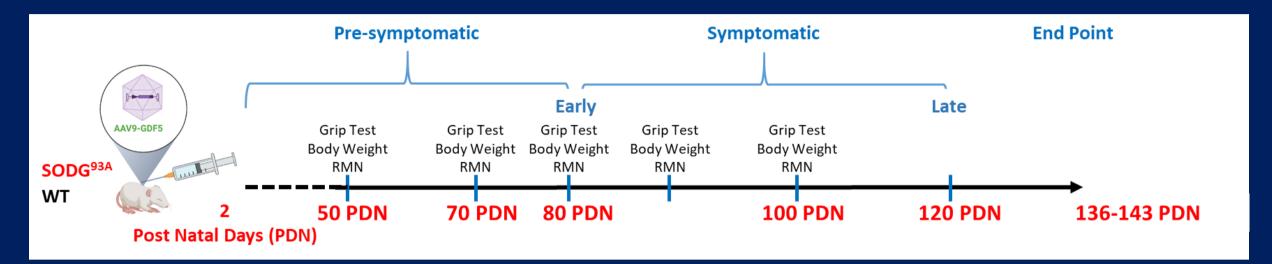

Therapeutic potential of GDF5 in ALS

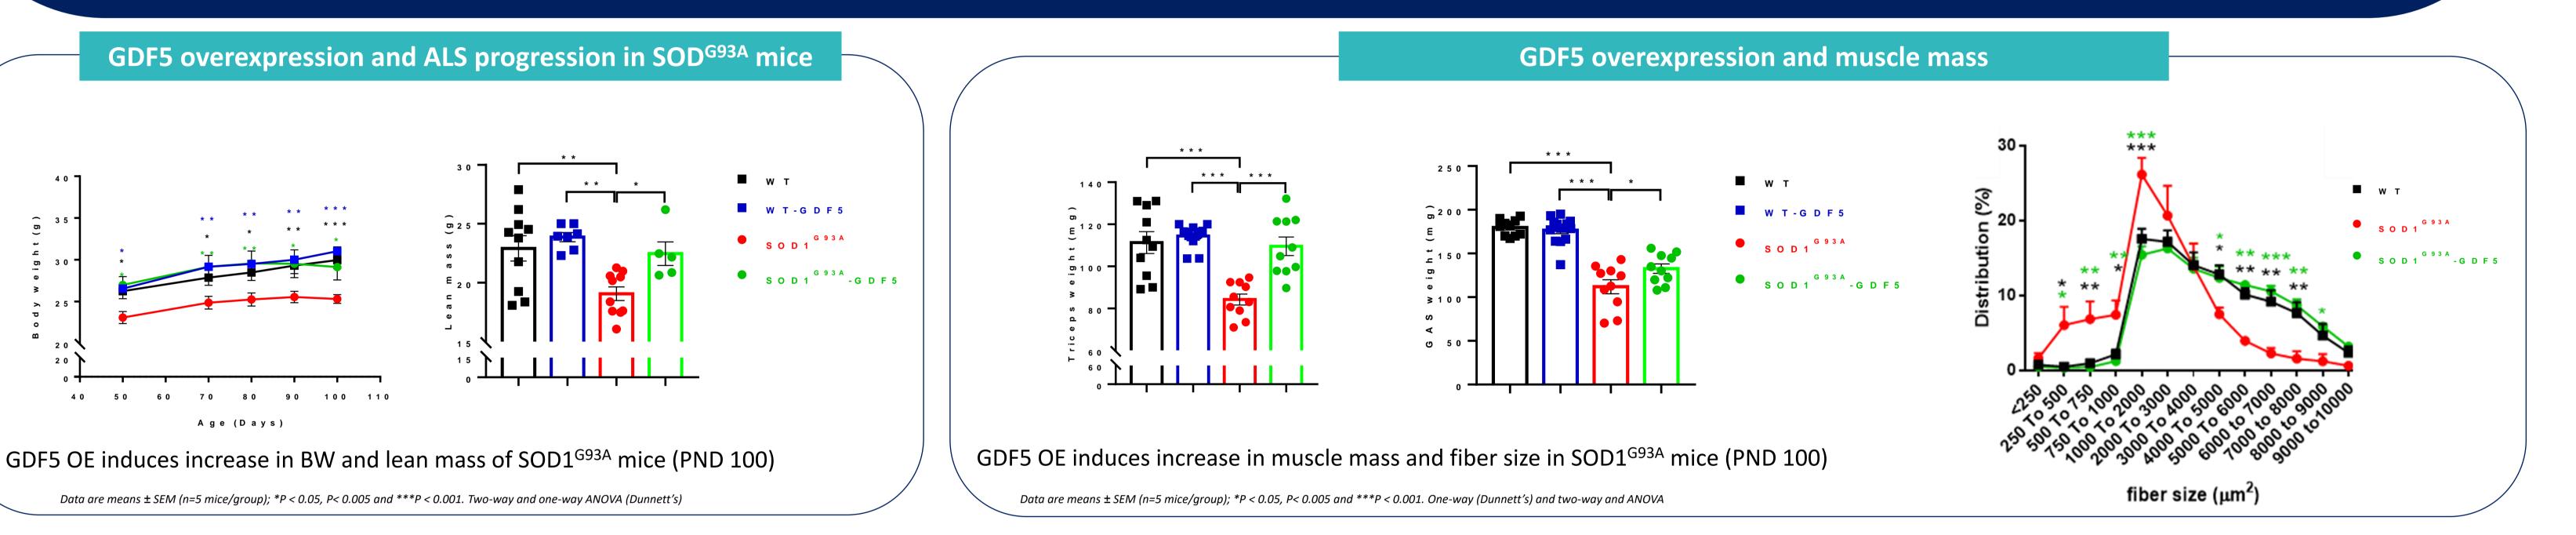

ALS-linked mutations: SOD1

- function mutations in the Cu/Zn superoxide dismutase-1

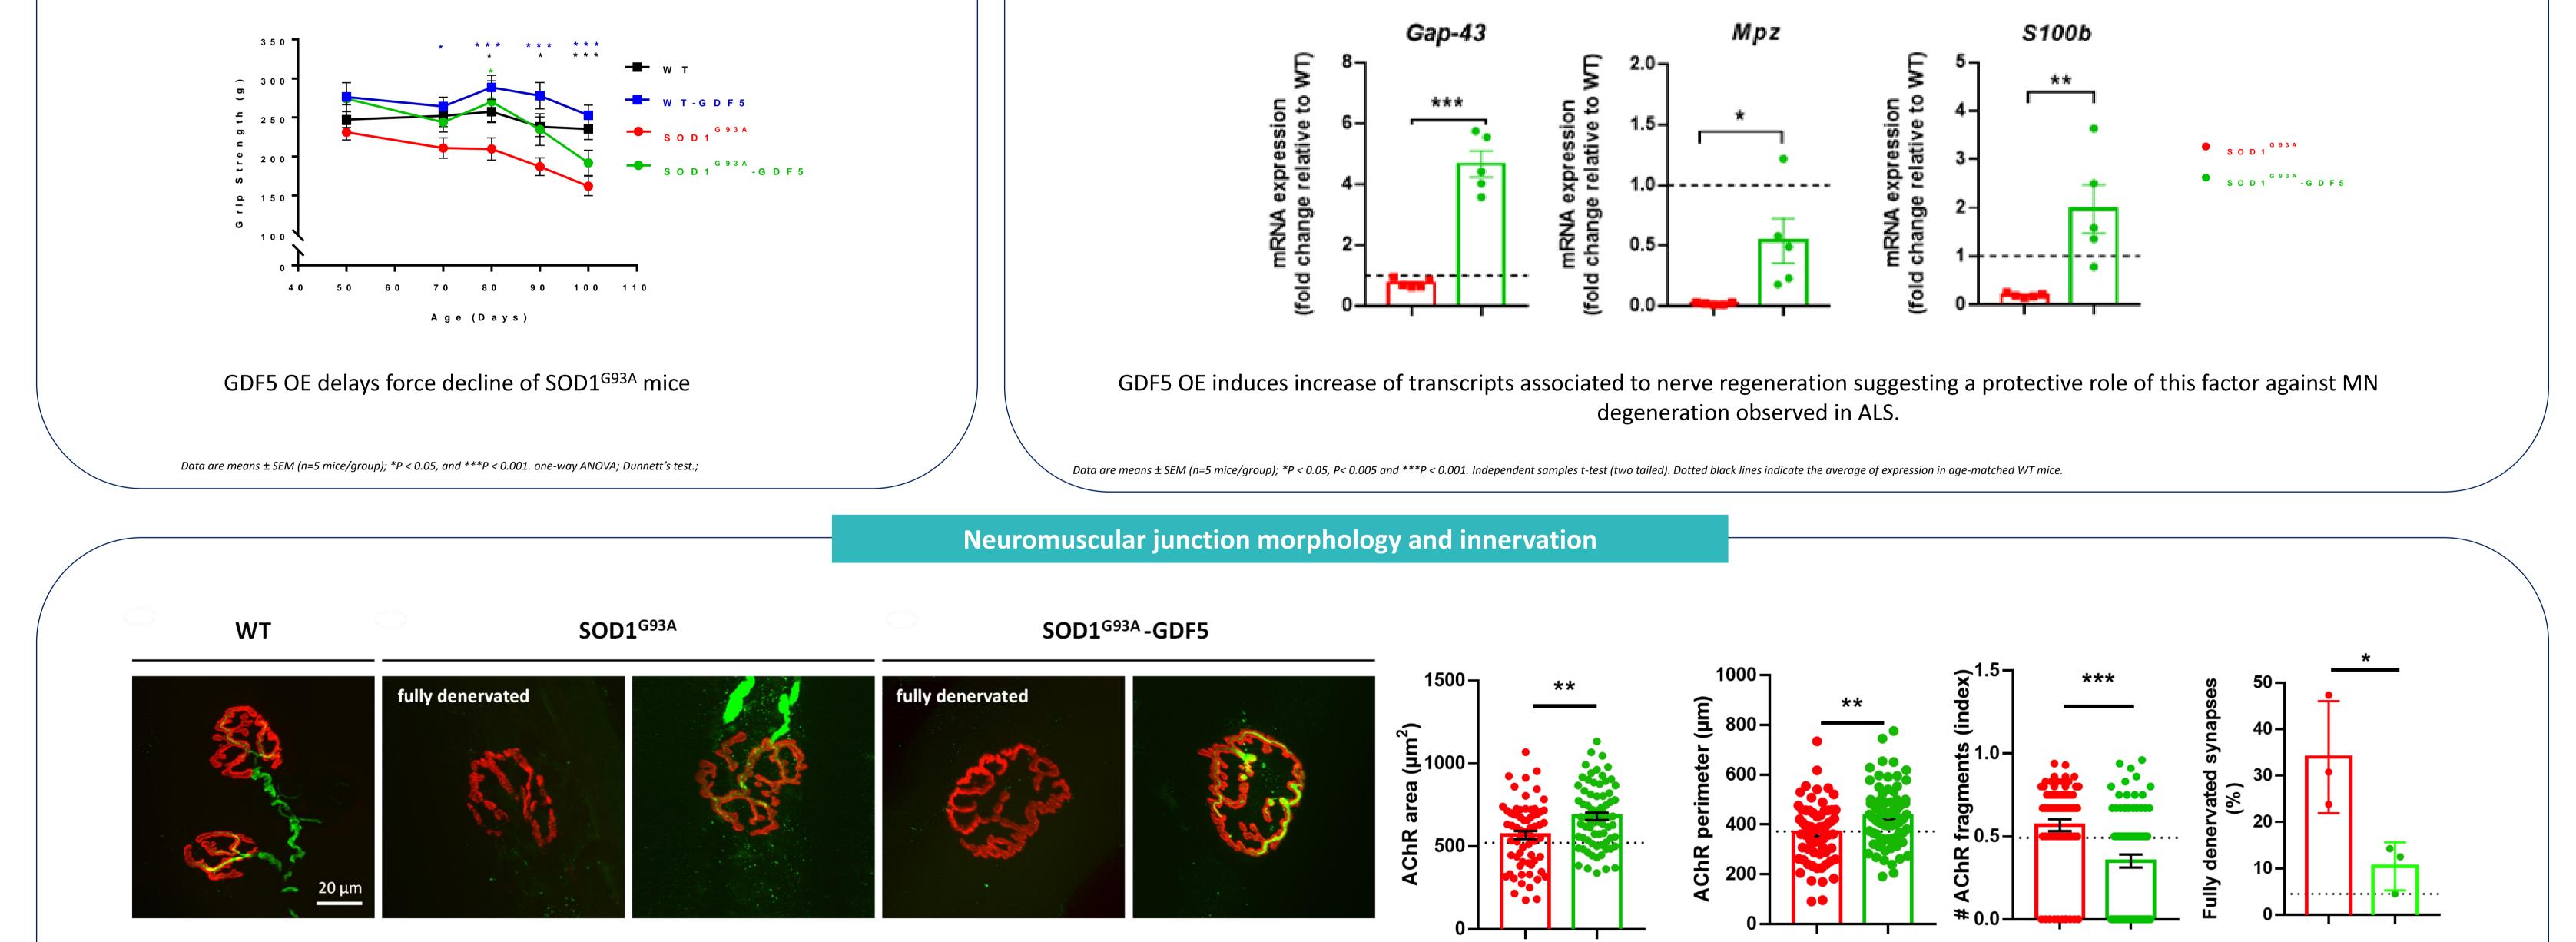

Nerve regeneration markers

Growth-associated protein 43 (GAP43): associated with regenerating axons and Schwann cells, Myelin Protein Zero (MPZ) and S100b increase during nerve regeneration

Acetylcholine Receptor (α -bungarotoxin)

40

(35 6)

<u></u>≻ 2

20

Synapses are more stable in GDF5 OE muscles, with increased endplates area and perimeters and decreased AChR fragmentation index and percentage of fully denervated synapses

Data are means ± SEM (n= 66/75 counted endplatesn=3 mice/group); *P < 0.05, P< 0.005 and ***P < 0.001. Independent samples t-test (two tailed). Dotted black lines indicate the average of expression in age-matched WT mice

Conclusions

- **Benefits of GDF5 overexpression in ALS:**
- ✓ Maintains muscle mass and fibers size and delays grip strength decline
 - ✓ Shows a positive impact on nerve regeneration markers
 - Exerts a protective effect against muscle denervation

Perspectives

Establishment of GDF5 therapeutic potential in ALS

- Effects of GDF5 on neuro-inflammation, motor neuron viability and survival
 - Evaluation of tissue-specific GDF5 expression on ALS pathophysiology
- ✓ Therapeutic test of GFD5 in adult ALS mice and in combination with a gene therapy
